

Check Point Exposure Management

From Intelligence to Action - Instantly. Safely. At Scale

Why It Matters

Every organization already sees the problem. Scanners, dashboards, feeds - all pointing to what's wrong. But what's missing is the bridge from visibility to verified action.

Security teams are drowning in insights they can't operationalize: SOC, vulnerability and infrastructure security teams - each sees a fragment, each running its own tools, its own truth. The result? Endless alerts, duplicated tickets, delayed fixes, rising exposure. Dashboards multiply. Risk isn't reduced.

Check Point Exposure Management closes that gap, unifying intelligence, exposure context, and safe remediation into a single preemptive engine that keeps business moving while risk goes down.

Dashboards don't protect you. Actions do.

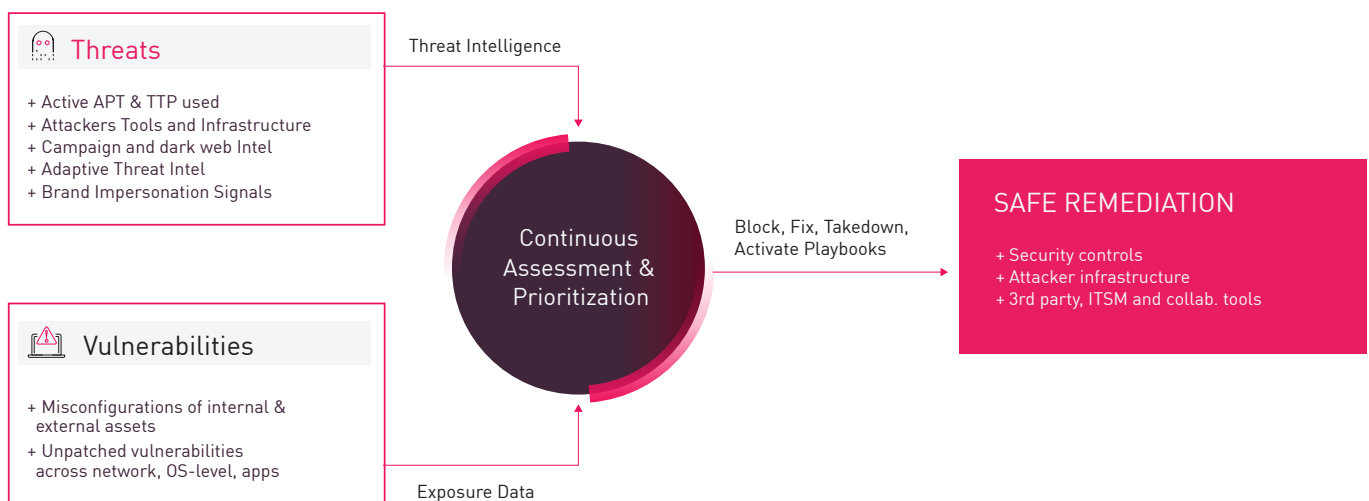

How It Works: Intelligence → Assessment → Safe Remediation

Unified Intelligence Fabric – Know What's Targeted. Not Just What's Vulnerable

Attackers don't start from your CVEs - they start from your attack surface.

Check Point fuses the industry's richest threat intelligence with live external-risk visibility - brand abuse, leaked credentials, dark-web chatter, phishing kits - all mapped to your environment. Outside-in insight meets inside-out telemetry from security tools across network, cloud and endpoints.

You don't just see exposures; you see what's being weaponized right now.

Exposure Assessment – Prioritize What Matters

Visibility alone doesn't reduce risk. Check Point correlates vulnerabilities, misconfigurations, and control gaps across your hybrid environment, ranking them by exploitability, exposure level, and existing compensating controls.

Every finding is scored dynamically and tied to live adversary behavior, so teams know not just what's critical, but what's critical to fix first.

The result: a short, verified list of exposures that truly matter to your business - prioritized, validated, and ready for safe remediation.

Safe Remediation - Close the Loop Without Breaking Anything

Remediation without disruption is the new security benchmark. Check Point automates risk reduction through virtual patching, IPS activations, IoC dissemination, adaptive blocklists, phishing-kit takedowns, and configuration hardening, validated for business continuity before enforcement.

Externally, attacker infrastructure is dismantled. Internally, protections are optimized and re-enabled where coverage was missing or drifted.

The result: continuous exposure closure - safe, verified, and measurable

From Awareness to Assurance

Security teams don't need more visibility - they need certainty.

Check Point Exposure Management delivers that certainty, turning fragmented intelligence and vulnerability data into validated, safe remediation across every control, at scale.

It's not about knowing what's wrong. It's about doing what's right before it matters.

Summary

Check Point Exposure Management is the industry's first preemptive defense engine that unifies threat intelligence, vulnerability insight, and safe remediation into one continuous loop. It transforms fragmented data into verified action - dismantling attacker infrastructure externally and hardening defenses internally. With its Unified Intelligence Fabric, Open-Garden orchestration, and safe-by-design automation, it doesn't just show you risk, it removes it, proving measurable exposure reduction across every layer of your security stack.

Why Organizations Choose Check Point

Unified Intelligence Fabric - Fuse external adversary data with internal telemetry for continuous, contextual action.

Preemptive by Design - Move from reactive response to continuous prevention. Fewer incidents, stronger uptime, measurable trust.

Open-Garden Integration - All your tools, finally acting as one. Native across Check Point. Open across everything else.

Safe-by-Design - Every change validated before impact. Fix faster without fear.

Proof, Not Promises - Measurable exposure reduction, visible ROI, and verifiable uptime.

The Outcome

Fewer alerts. More fixes.

Shorter time to safe remediation.

Continuous risk reduction
