Security Risks: The Threat is Real
How protected is your infrastructure?

It’s not so much a question of if IT will be attacked, but when. As threats evolve and new weaknesses are discovered, businesses are more vulnerable than ever. The old method of safeguarding your network through patches and perimeter protection simply doesn’t work against today’s security threats.

The answer: a proactive shift from perimeter security to application and data security. Two partners, ePlus and HPE, can help get you there.
Barriers To Safety

Most businesses are struggling to adapt to the new security game where attackers seek out the easiest point of entry. And the challenges don’t stop there:

- More sophisticated cyber attacks
- Cost and complexity of regulatory pressures
- Antiquated security detection systems
The Threat Landscape

Thanks to the rapid transformation of enterprise IT, traditional network security tactics provide less and less data protection:

- 56% of organizations have been the target of a cyber attack
- 75% of mobile apps have critical vulnerabilities
- 80% of open-source apps have security vulnerabilities
- 100k Banking Trojans detected
Application Security: The New Perimeter

There was a time when a secure perimeter could keep threats at bay. No longer. The modern enterprise workplace involves users accessing numerous applications and putting sensitive data at risk. The key? Securing users and data (as opposed to just devices):

- **84% of breaches target applications**
- **Social engineering can defeat even the most secure networks**
- **Effective security covers the entire software development lifecycle**
- **Finding a trusted partner can help you assess your security needs**
Secure IT... the Right Way

The answer to your security woes? ePlus partners with HPE to deliver a suite of application and data security solutions that help meet the ever-changing needs of IT. Secure your infrastructure where it matters most:

- **Secure Development:** Find and fix as developers code
- **Security Testing:** Expand testing to web, mobile, and cloud applications in production
- **Software Security Assurance:** Get a programmatic approach to securing applications at scale
Cyber Crime Has Found A Way Around The Perimeter.

Fortunately, there’s a reliable solution that can help IT departments prevent data breaches, detect and respond to threats, and recover faster. IT professionals turn to ePlus and HPE as their trusted application and data security experts.
